

## ER MODEL

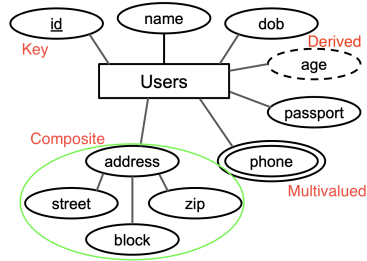

### Entity

- Objects that are distinguishable from other objects
- Entity set:** Collection of entities of the same type

### Attribute

- Specific information describing an entity

- Key attr** uniquely identifies each entity
- Composite attr** composed of multiple other attributes
- Multivalued attr** may consist of more than one value for a given entity
- Derived attr** derived from other attributes

### Relationship

Association among two or more entities

### Relationship set

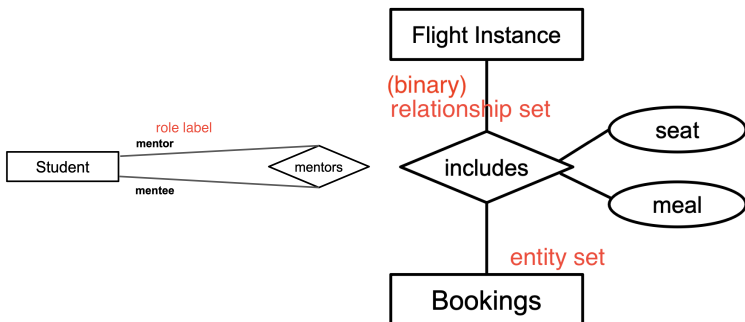

- Collection of relationships of the same type
- Can have their own attributes that further describe the relationship
- $Key(E_i)$  is the attributes of the selected key of entity set  $E_i$

### Role

- Describes an entity set's participation in a relationship
- Explicit role label only in case of ambiguities (e.g. same entity set participates in same relationship more than once)

### Degree

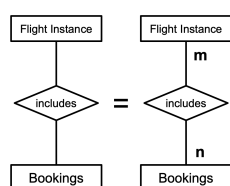

- An  $n$ -ary relationship set involves  $n$  entity roles, where  $n$  is the degree of the relationship set
- Typically binary or ternary

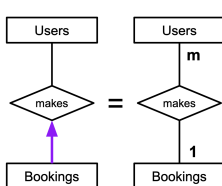

### Cardinality constraints

- Upper bound** for entity's participation

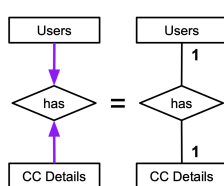

#### Many-to-Many

#### Many-to-One

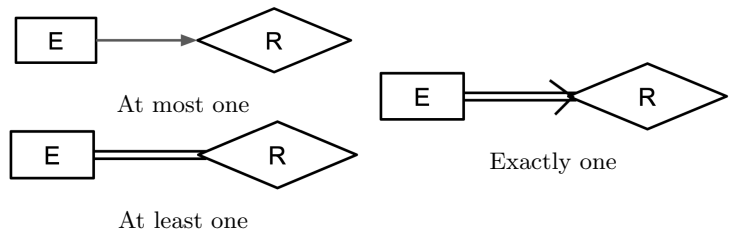

#### One-to-One

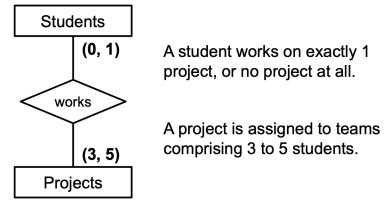

### Participation constraints

- Lower bound** for entity's participation
- Partial (default): participation not mandatory
- Total: mandatory (at least 1)

### Alternative

### Implementation

**Many-to-Many** Represent relationship set with a table

### Many-to-One

- Represent relationship set with a table
- Combine rel. set and total participation entity set into one table

### One-to-One

- Represent relationship set with a table
- Combine relationship set and either entity set into one table

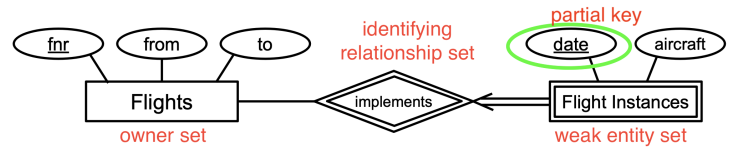

### Dependency constraints

#### Weak entity sets

- Entity set that does not have its own key
- Can only be uniquely identified by considering primary key of owner entity
- Existence depends on existence of owner entity

#### Partial key

- Set of attributes of weak entity set that uniquely identifies a weak entity, for a given owner entity

### Requirements

- Many-to-one relationship from weak entity set to owner entity set
- Weak entity set must have total participation in identifying relationship

### Relational mapping

- Entity set  $\rightarrow$  table
- Composite/multivalued attributes:
  - Convert to single-valued attributes
  - Additional table with FK constraint
  - Convert to a single-valued attribute (e.g. comma separated string)

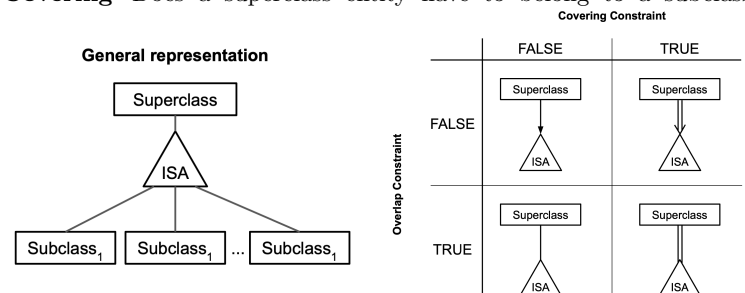

### ISA Hierarchies

- "Is a" relationship - used to model generalization/specialization of entity sets

### Constraints

**Overlap** Can a superclass entity belong to multiple subclasses?

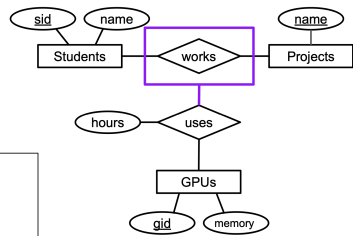

**Covering** Does a superclass entity have to belong to a subclass?

# Aggregation

- Abstraction that treats relationships as higher-level entities

- Schema definition of "uses"
- Primary key of aggregation relationship → (sid, pname)
  - Primary key of associated entity set "GPUs" → gid
  - Descriptive attributes of "uses" → hours

```
CREATE TABLE Uses (
  gid          INTEGER,
  sid          CHAR(20),
  pname       VARCHAR(50),
  hours       NUMERIC,
  PRIMARY KEY (gid, sid, pname),
  FOREIGN KEY (gid) REFERENCES GPUs(gid),
  FOREIGN KEY (sid, pname) REFERENCES works(sid, pname)
);
```

# FUNCTIONS AND PROCEDURES

```
-- Function
CREATE OR REPLACE FUNCTION <name>
(<param> <type>, ...)
RETURNS <type> AS $$
  <code>
$$ LANGUAGE <sql | plpgsql>;

-- Procedure
CREATE OR REPLACE PROCEDURE <name>
(<param> <type>, ...) AS $$
  <code>
$$ LANGUAGE <sql | plpgsql>;
```

- CREATE OR REPLACE** helps to re-declare function/procedure if already previously defined
- Code is enclosed within **\$\$**
- Call a function: **SELECT \* FROM swap(2, 3);**
- Call a procedure: **CALL transfer('Alice', 'Bob', 100);**

# Return types

Return	Type
Single tuple from table	<table_name>
Set of tuples from table	SET OF <table_name>
Single new tuple	RECORD
Set of new tuples	SET OF RECORD or TABLE(c VARCHAR, x INT)
No return value	VOID, or use PROCEDURE instead of FUNCTION
Trigger	TRIGGER

# Control structures

## Variables

- DECLARE** [<var> <type>] (1 or more when **DECLARE** keyword is present)
- <var> := <expr>

## Selection

- IF ... THEN ...**  
[**ELSIF ... THEN ...**]  
[**ELSE ...**] **END IF**  
(0 or more **ELSIF**)

## Repetition

- LOOP ... END LOOP**, and **EXIT ... WHEN ...** (conditional exit)
- WHILE ... LOOP ... END LOOP**
- FOR ... IN ... LOOP ... END LOOP**
- 1..10 (range, inclusive)

## Block

- BEGIN ... END**
- For plpgsql, code in the **BEGIN-END** block is in a transaction

## Examples

Note: **INOUT** specifies that the param is both an input and output param

## Function

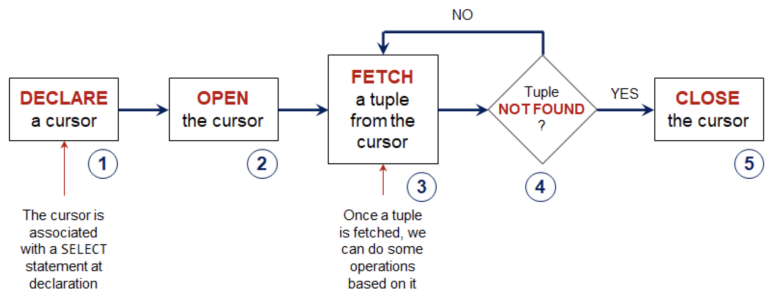

```
CREATE OR REPLACE FUNCTION
  swap(INOUT val1 INT,
        INOUT val2 INT)
RETURNS RECORD AS $$
DECLARE
  temp INT;
BEGIN
  temp := val1;
  val1 := val2;
  val2 := temp;
END;
$$ LANGUAGE plpgsql;
```

## Procedure

```
CREATE OR REPLACE PROCEDURE
  transfer(
    src TEXT, dst TEXT,
    amt NUMERIC
  ) AS $$
  UPDATE Accounts
  SET balance = balance - amt
  WHERE name = src;
  UPDATE Accounts
  SET balance = balance + amt
  WHERE name = dst;
$$ LANGUAGE sql;
```

# Cursor

- Declare, Open, Fetch, Check (repeat), Close
- FETCH** [**PRIOR** | **FIRST** | **LAST** | **ABSOLUTE** n] [**FROM**] <cursor> **INTO** <var>

## Question

Given the table "Scores" from before, write a function to perform the following task:

- Sort the students in "Scores" in *descending* order of their Mark (*break ties arbitrarily*)
- For each student, compute the *difference* between his/her Mark and the Mark of the previous student
  - If there is no previous student, use **NULL**

## Solution

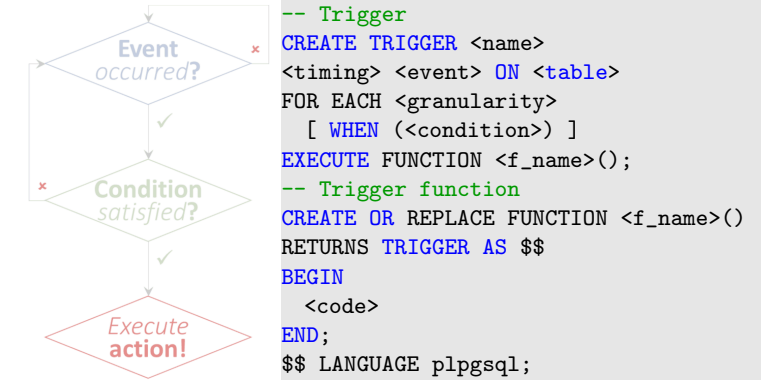

```
CREATE OR REPLACE FUNCTION score_gap()
RETURNS TABLE(name TEXT, mark INT, gap INT) AS $$
DECLARE
  curs CURSOR FOR (SELECT * FROM Scores ORDER BY Mark DESC);
  r RECORD; prev INT;
BEGIN
  prev := -1; OPEN curs;
  LOOP
    FETCH curs INTO r;
    EXIT WHEN NOT FOUND;
    name := r.Name; mark := r.Mark;
    IF prev >= 0 THEN gap := prev - mark;
    ELSE gap := NULL;
    END IF;
    RETURN NEXT; -- insert into output
    prev := r.mark;
  END LOOP;
  CLOSE curs;
END;
$$ LANGUAGE plpgsql;
```

## Explanation

- Declare a **cursor** associated with a **SELECT** statement
  - r is a **RECORD** to store previous row
- Open** the cursor which executes the SQL statement and let the cursor point to the **beginning** of the result
- Fetch** a tuple from the cursor by reading the **next** tuple from cursor and assign into the variable
- If the **FETCH** operation did not get any tuple, the loop **terminates**
  - Otherwise, perform the **main operation** and insert into output
- Close** the cursor to release the resources allocated

# TRIGGERS

- Note: cannot **CREATE OR REPLACE TRIGGER**. Need to **DROP TRIGGER**

# Trigger options

## Events

- INSERT ON <table>**
- DELETE ON <table>**
- UPDATE [ OF <column> ] ON <table>**
- INSERT OR DELETE OR UPDATE ON <table>**
- Alternatively, use **TG\_OP** variable. Is set to **'INSERT'** | **'DELETE'** | **'UPDATE'**

## Timings

- AFTER/BEFORE** (after/before event)
- INSTEAD OF** (replaces event, only for **VIEWS**)

## Granularity

- FOR EACH ROW** (for each tuple encountered)
- FOR EACH STATEMENT** (for each statement)

## Effect of return value

- OLD / NEW**: Modified row before / after the triggering event

Events + Timings	NULL tuple	Non-NULL tuple t
BEFORE <b>INSERT</b>	No insertion	t is inserted
BEFORE <b>UPDATE</b>	No update	t is the updated tuple
BEFORE <b>DELETE</b>	No deletion	Deletion proceeds as normal
AFTER	No effect	No effect

Granularity

- In FOR EACH STATEMENT, doing RETURN NULL will not do anything
- Need to use RAISE EXCEPTION to stop the operation

Trigger condition

- Use WHEN() for conditional check whether a trigger should run
- e.g. WHEN (NEW.StuName = 'Adi')

Usage

- |                               |                               |
|-------------------------------|-------------------------------|
| • No SELECT in WHEN()         | • No NEW in WHEN() for DELETE |
| • No OLD in WHEN() for INSERT | • No WHEN() for INSTEAD OF    |

Deferred triggers

- Triggers that are checked only at the end of a transaction
- CONSTRAINT + DEFERRABLE together indicate that the trigger can be deferred
- Only works with AFTER and FOR EACH ROW
- Default is IMMEDIATE

```
CREATE CONSTRAINT TRIGGER <name>
AFTER <event> ON <table>
FOR EACH ROW
[ WHEN (<condition>) ]
[ DEFERRABLE INITIALLY [ DEFERRED | IMMEDIATE ] ]
EXECUTE FUNCTION <func_name>();
```

Multiple triggers

- Activation order for the same event on the same table:
- |                                    |                                   |
|------------------------------------|-----------------------------------|
| 1. BEFORE statement-level triggers | 3. AFTER row-level triggers       |
| 2. BEFORE row-level triggers       | 4. AFTER statement-level triggers |
- Activation order for the same event on the same table:
  - Within the same category, triggers are activated in alphabetical order
  - If BEFORE row-level trigger returns NULL, then subsequent triggers on the same row are omitted

FUNCTIONAL DEPENDENCIES

Basic terminology

**Reading FDs**  $X \rightarrow Y$  reads:  $X$  (functionally) determines  $Y$  |  $Y$  is functionally dependent on  $X$  |  $X$  implies  $Y$  (casual)

**Instance** An instance  $r$  (a table) of a relation  $R$  satisfies the FD  $\sigma : X \rightarrow Y$  with  $X \subset R$  and  $Y \subset R$ ,  $\iff$  if two tuples of  $r$  agree on their  $X$ -values, then they agree on their  $Y$ -values

**Valid instance** An instance  $r$  of relation  $R$  is a valid instance of  $R$  with  $\Sigma \iff$  it satisfies  $\Sigma$

Violations

- Instance  $r$  of rel.  $R$  violates a set of FDs  $\Sigma \iff$  does not satisfy  $\Sigma$
- Instance  $r$  of rel.  $R$  violates a set of FDs  $\sigma \iff$  does not satisfy  $\sigma$

Holds

- A relation  $R$  with a set of FDs  $\Sigma$ ,  $R$  with  $\Sigma$ , refers to the set of valid instances of  $R$  wrt. to the FDs in  $\Sigma$
- When a set of FDs  $\Sigma$  holds on a relation  $R$ , only consider the valid instances of  $R$  with  $\Sigma$

**Trivial**  $X \rightarrow Y$  is trivial  $\iff Y \subset X$

**Non-trivial**  $X \rightarrow Y$  is non-trivial  $\iff Y \not\subset X$

**Completely non-trivial**  $X \rightarrow Y$  is completely non-trivial  $\iff Y \neq \emptyset$  and  $Y \cap X = \emptyset$

Key terminology

**Superkey** Let  $S \subset R$  be a set of attributes of  $R$ .  $S$  is a superkey of  $R \iff S \rightarrow R$

**Candidate key** A superkey such that no proper subset is also a superkey

**Primary key** Chosen candidate key, or the candidate key if there is only one

**Prime attribute** An attribute that appears in some candidate key of  $R$  with  $\Sigma$ . If not, then it is a non-prime attribute

FD terminology

**Closure** Let  $\Sigma$  be a set of FDs of a relation  $R$ . The closure of  $\Sigma$ , denoted  $\Sigma^+$ , is the set of all FDs logically entailed by the FDs in  $\Sigma$

**Equivalence** Two FDs are equivalent  $\iff$  have the same closure

**Cover**  $\Sigma_1$  is a cover of  $\Sigma_2$  (and vice versa)  $\iff$  their closure are equivalent

**Closure of a set of attributes** Let  $\Sigma$  be a set of FDs of a relation  $R$ . The closure of a set of attributes  $S \subset R$ , denoted  $S^+$ , is the set of all attributes that are functionally dependent on  $S$  (i.e. what  $S$  implies)  
 $S^+ = \{A \in R \mid \exists(S \rightarrow \{A\}) \in \Sigma^+\}$

Computing attribute closures

- Check if any attribute doesn't appear in the RHS of any FD. These attributes must appear in the key
- Compute attribute closure starting with singular attributes. Then compute for 2 elements, 3 elements and so on.
- Note all candidate keys in the process
- If current set of attributes is a superset of some previously seen, candidate key, can skip

Armstrong axioms

**Reflexivity**  $\forall X, Y \subset R \quad ((Y \subset X) \Rightarrow (X \rightarrow Y))$

**Augmentation**  $\forall X, Y, Z \subset R \quad ((X \rightarrow Y) \Rightarrow (X \cup Z \rightarrow Y \cup Z))$

**Transitivity**  $\forall X, Y, Z \subset R \quad ((X \rightarrow Y) \wedge (Y \rightarrow Z) \Rightarrow (X \rightarrow Z))$

Remarks

- |  |  |
|--|--|
| • <b>Sound:</b> The rule only generates elements of $\Sigma^+$ when applied to $\Sigma$        | • The three inference rules are (individually) sound     |
| • <b>Complete:</b> The rule(s) generate(s) all elements of $\Sigma^+$ when applied to $\Sigma$ | • The Armstrong axioms are (together) sound and complete |

Additional rules

These rules may be useful, but must be derived during exam.

Weak augmentation

If  $X \rightarrow Y$ , then  $X \cup Z \rightarrow Y$

Proof

1.  $X \rightarrow Y$  (given)
2. We know that  $X \subset X \cup Z$
3.  $X \cup Z \rightarrow X$  (reflexivity)
4.  $X \cup Z \rightarrow Y$  (trans. of 3 and 1)

Union

If  $X \rightarrow Y$  and  $X \rightarrow Z$ , then  $X \rightarrow Y \cup Z$

Proof

1.  $X \rightarrow Y$  (given)
2.  $X \rightarrow Z$  (given)
3.  $X \rightarrow X \cup Z$  (aug. 2 and  $X$ )
4.  $X \cup Z \rightarrow Y \cup Z$  (aug. 1 and  $Z$ )
5.  $X \rightarrow Y \cup Z$  (trans. of 3 and 4)

Pseudo-transitivity

If  $X \rightarrow Y$  and  $Y \cup Z \rightarrow W$ , then  $X \cup Z \rightarrow W$

Proof

1.  $X \rightarrow Y$  (given)
2.  $Y \cup Z \rightarrow W$  (given)
3.  $X \cup Z \rightarrow Y \cup Z$  (aug. of 1 and  $Z$ )
4.  $X \cup Z \rightarrow W$  (trans. of 3 and 2)

Decomposition

If  $X \rightarrow Y \cup Z$ , then  $X \rightarrow Y$  and  $X \rightarrow Z$

Proof

1.  $X \rightarrow Y \cup Z$  (given)
2.  $Y \cup Z \rightarrow Y$  (reflexivity)
3.  $X \rightarrow Y$  (trans. of 1 and 2)

Composition

If  $X \rightarrow Y$  and  $A \rightarrow B$ , then  $X \cup A \rightarrow Y \cup B$

Proof

1.  $X \rightarrow Y$  (given)
2.  $A \rightarrow B$  (given)
3.  $X \cup A \rightarrow Y \cup A$  (aug. 1 and  $A$ )
4.  $X \cup A \rightarrow Y$  (decomp. of 3)
5.  $X \cup A \rightarrow X \cup B$  (aug. 2 and  $X$ )
6.  $X \cup A \rightarrow B$  (decomp. of 5)
7.  $X \cup A \rightarrow Y \cup B$  (union 4 and 6)

Minimal cover

Definition

A set  $\Sigma$  of FDs is minimal if and only if

- RHS of each FD in  $\Sigma$  is minimal, i.e. each FD is of the form  $X \rightarrow \{A\}$
- LHS of each FD in  $\Sigma$  is minimal, i.e. for every FD in  $\Sigma$  of the form  $X \rightarrow \{A\}$ , there is no FD  $Y \rightarrow \{A\}$  such that  $Y \subset X$
- The set is minimal, i.e. no FD in  $\Sigma$  can be derived from other FDs in  $\Sigma$

Misc

- A minimal cover of a set of FDs  $\Sigma$  is a set of FDs  $\Sigma'$  that is both minimal and equivalent to  $\Sigma$
- Every set of FDs has a minimal cover

Algorithm

1. Simplify RHS of every FD (by splitting FDs so that RHS of each FD is a singleton)
2. Simplify LHS of every FD (if a subset of LHS can imply RHS, then replace LHS with the subset)
3. Remove redundant FDs (if a FD can be derived from other FDs, then remove it)
4. (If compact cover is desired) Combine FDs with same LHS

Reachability

- The algorithm always finds a minimal cover
- Some minimal covers may be unreachable
- To reach all minimal covers, the algorithm needs to start from  $\Sigma^+$

ANOMALIES AND BCNF

Anomalies

proficiency					
name	userid	domain	department	faculty	language
Tan Hee Wee	tanh	comp.sut.edu	computer science	computing	JavaScript
Tan Hee Wee	tanh	comp.sut.edu	computer science	computing	Python
Tan Hee Wee	tanh	comp.sut.edu	computer science	computing	C++

Goh Jin Wei	go	comp.sut.edu	information systems and analytics	computing	Python
Tan Hee Wee	tanhw	eng.sut.edu	computer engineering	engineering	C++
Tan Hee Wee	tanhw	eng.sut.edu	computer engineering	engineering	Fortran
Bjorn Sale	bjorn	eng.sut.edu	computer engineering	engineering	C++
Bjorn Sale	bjorn	eng.sut.edu	computer engineering	engineering	Fortran
Tan Hooi Ling	tanh	sci.sut.edu	physics	science	Julia
Tan Hooi Ling	tanh	sci.sut.edu	physics	science	Fortran
Roxana Nassi	rox	sci.sut.edu	mathematics	science	R
Amirah Mokhtar	ami	med.sut.edu	pharmacy	medecine	R

- Department  $\rightarrow$  faculty is a FD in this example

Redundant storage

The faculty of a department is repeated for every student of the department, and every time the student is proficient in a language

Update anomaly

Two rows of the table have the same value for the column **department** but different values for the column **faculty**, violating the FD

Deletion anomaly

If we delete the last row, we may forget that we have a department of pharmacy, and a faculty of medicine

Insertion anomaly

We cannot record that the department of social science exists and the faculty of liberal arts exists, because there is no student from this department or this faculty

Solution

- In all cases, the solution is to remove faculty from the original table, and create a new table with department and faculty
- In the case of the update anomaly, to enforce the FD, we also need to make department the primary key of the new table

Normalization

Normal forms

- Recognize designs that enforce FDs through main SQL constraints (PK, unique, not null, FK constraints)
- Protect data against anomalies

Normalization

Transform (decompose) a poor design into one that enforces FDs by means of the main SQL constraints

Boyce-Codd Normal Form

A relation  $R$  with a set of FDs  $\Sigma$  is in BCNF  $\iff$  for every FD  $X \rightarrow \{A\} \in \Sigma^+$ ,

- either  $X \rightarrow \{A\}$  is trivial, or
- $X$  is a superkey

Check if decomposed set of relations is in BCNF

1. Compute attribute closures of the original set, and project FDs to each relation  $R_i$
2. If some  $R_i$  is not in BCNF, then FALSE
3. For some pair  $(R_i, R_j), i \neq j$ ,
  - Check that  $R_i \cap R_j \rightarrow R_i$  or  $R_i \cap R_j \rightarrow R_j$
  - If yes, then replace  $R_i, R_j$  with  $R_i \cup R_j$  and repeat Step 2-5.
  - If no, then try next pair
4. If there was a sequence of unions that respected the BCNF definitions, resulting in a single relation that has all attributes, then TRUE. Else FALSE

Decomposition

Terminology

**Decomposition** A decomposition of table  $R$  is a set of tables  $\{R_1, R_2, \dots, R_n\}$  such that  $R = R_1 \cup \dots \cup R_n$

**Binary decomp** Decomposition with  $n = 2$

Lossless-join definitions

- A binary decomp is lossless-join  $\iff$  full outer natural join of its two fragments (tables resulting from the decomp) equal the initial table. Otherwise it is lossy
- A binary decomp of  $R$  into  $R_1$  and  $R_2$  is lossless-join if  $R = R_1 \cup R_2$  and either  $R_1 \cap R_2 \rightarrow R_1$  or  $R_1 \cap R_2 \rightarrow R_2$
- A decomp is lossless-join if there exists a sequence of binary lossless-join decomp that generates that decomp

**Projected FDs** A set  $\Sigma$  of projected FDs on  $R'$ , from  $R$  with  $\Sigma$  where  $R' \subset R$ , is the set of FDs equivalent to the set of FDs  $X \rightarrow Y$  in  $\Sigma^+$  such that  $X \subset R'$  and  $Y \subset R'$

**Dependency preserving** A decomposition of  $R$  with  $\Sigma$  into  $R_1, R_2, \dots, R_n$  with respective projected FDs  $\Sigma_1, \Sigma_2, \dots, \Sigma_n$  is dependency preserving  $\iff \Sigma^+ = (\Sigma_1 \cup \dots \cup \Sigma_n)^+$

Decomposition algorithm

- Guarantees lossless decomp
- Decomp may not be dependency preserving
- Can get different results depending on order of FD chosen

Let  $X \rightarrow Y$  be a FD in  $\Sigma$  that violates the BCNF definition (not trivial, and  $X$  not superkey). Use it to decompose  $R$  into  $R_1$  and  $R_2$ :

- $R_1 = X^+$
- $R_2 = (R - X^+) \cup X$

Then, check whether  $R_1$  and  $R_2$  with respective projected FDs  $\Sigma_1$  and  $\Sigma_2$  are in BCNF. Repeat the decomposition algorithm for the fragments which are not.

3NF

Definition

A relation  $R$  with a set of FDs  $\Sigma$  is in 3NF  $\iff$  for every FD  $X \rightarrow \{A\} \in \Sigma^+$ ,

- $X \rightarrow \{A\}$  is trivial, or
- $X$  is a superkey, or
- $A$  is a prime attribute

Note that BCNF implies 3NF

Synthesis

Guarantees a lossless, dependency preserving decomp in 3NF

- For each FD  $X \rightarrow Y$  in the compact minimal cover, create a relation  $R_i = X \cup Y$  unless it already exists, or is subsumed by another relation
- If none of the created relations contains one of the keys, pick a candidate key and create a relation with that candidate key
